Thirty-two states are on the path to UN-inspired carbon reduction, Cap-and-Trade schemes and unconstitutional alliances; the supporting Governors must be held accountable. Carbon reduction and population reduction go hand in hand. The United Nations failed to impose their treaties from the top down (the Kyoto and Copenhagen Accords) and the federal government has abandoned its unpopular national Cap-and-Trade scheme for now. Cap-and-Trade is being pursued on the state level, and one region has even raised over \$700 million in carbon auctions.

The thirty-two states have been divided into three regions; regionalism is a trick that uses

re-zoning to establish new jurisdictional authority. State compacts and agreements, in addition to state treaties with foreign governments, are [unconstitutional](#). While these regional programs have avoided mention of United Nations Agenda 21, the blueprint for depopulation total control, evidence supports that this is an Agenda 21 Sustainable Development program for the following reasons:

- Man made global warming deception, based on [discredited science](#) from the United Nations Intergovernmental Panel on Climate Change (UN IPCC), is a primary excuse used to implement Agenda 21 Sustainable Development.
- [California's AB 32](#) Global Warming Solutions Act is committed to achieving the targets of the UN Kyoto Protocol (a treaty with mandatory rules to limit carbon).
- [RGGI](#) (Regional Greenhouse Gas Initiative of the Northeastern states) is similar to the UN Kyoto treaty with mandated regulations and a Cap-and-Trade scheme.

THE SCIENCE

Because global warming has been discredited, it is now referred to as climate change, climate disruption and the greenhouse effect.

Many people may not realize that water vapor (H₂O) accounts for 97% of all greenhouse gases and human activity contributes only a fraction of 1% to greenhouse gas emissions. Yet there is alarmism over how much carbon humans emit. Temperature drives CO₂ levels. If it was beneficial to reduce carbon, limiting human carbon emissions would have no effect because human carbon emissions are so minuscule. Other gases like methane, nitrous oxide, ozone, etc. are not major greenhouse gases.

According to Dr. Michael Coffman, and over 30,000 other scientists, carbon dioxide (CO₂) is essential for life on Earth. All plants must have it to produce food for themselves. At the current atmospheric concentrations, CO₂ is limiting to plant growth. Currently, CO₂ levels are about 387 ppm, and even if the levels increased by 500%, it would benefit agriculture and the Earth's

atmosphere without any harm to humans or other animal life. The consensus that CO2 is harmful and that the science is "settled" is false.

Despite the fact that water vapor causes the overwhelming amount of greenhouse gas, the EPA failed to list it as a greenhouse gas in its ['Endangerment Finding'](#), most likely because people would then understand that water, like carbon, is harmless and would reject the idea that CO2 is a threat to public health and welfare. The objective of controlling greenhouse gases is to implement political policies, like the EPA's 18,000 page document with carbon reduction codes that also include a Cap-and-Trade scheme. This is another example of how the UN has used a governmental body to impose its schemes.

THE STATES

There are 23 states that are partnered within 3 regions, with the goal of reducing human carbon emissions that can cause economic devastation. There are 9 additional states that are "observers" to these regional alliances, which means that they have taken some steps toward joining. The Governors of these 32 states seem to have been duped by discredited UN global warming "science", or they fear standing up against the regional alliances, or they are globalists. Most of these Governors' seats are open in the upcoming November 2nd elections. If the current Governors refuse to remove their States from these alliances, they can be voted out of office.

The regional alliances and their programs are outlined below:

REGIONAL GREENHOUSE GAS INITIATIVE (RGGI)
